# ECM Migration

Migrate to your new ECM with confidence using FileFacets

Many organizations are uncertain as they face the daunting prospect of migrating to a new ECM. Migrating content that is unclassified, unattributed, or unorganized can clog the ECM with large quantities of unwanted data, or worse, derail the project entirely.

The FileFacets' solution eliminates these worries as it performs content analysis to prepare for migration and identifies potential errors, all while processing the ECM migration quickly and efficiently. FileFacets properly designs target repositories to reduce fragmentation which can cause performance issues.

What is FileFacets?

FileFacets is a robust ECM enhancement solution that facilitates Rot processing, auto classification, taxonomy implementation, and metadata mining and attribution. Unique to FileFacets is a reliable communication and pre-deployment staging area. FileFacets' SaaS model makes it a cost effective and easy-to-deploy solution.

What are the issues?

Content migration projects are often time-sensitive. Manually dragging and dropping content from a source to a target repository is too time consuming and therefore not feasible.

There are "lift-and-shift" tools that can manage a high volume of content, but they aren't equipped to weed out potential content problems. Using these types of solutions can perpetuate content errors that will adversely affect the new ECM.

Why FileFacets?

Organizations can confidently choose FileFacets' highly automated and scalable SaaS-based solution for an ECM implementation or migration undertaking. It is reliable, timely and cost-effective. It will weed out that unnecessary, undefined and repetitive content. And most importantly, will give you a "content-clean source for your new ECM.
